Abstract

We port the Phase-2 Jacobian-lens assay to Meta's Muse Glimmer 30B (52 layers $\times$ d = 6656), test residual-stack geometry, fit a 120-prompt WikiText lens, and run a compact battery of the strongest open-model cells from prior OLMo/Qwen work. Tier: development/methods only.

1 Geometry

- Shape: 52 $\times$ 6656; softcap=20.0
- Identity parity: True
- All pre-fit gates: True

2 Lens fit

- $n = 120$ WikiText (Phase-2 draw-A recipe)
- dim_batch=16; target layer 51
- sources: 21 layers

3 Battery headline

Cell	Value
J-lens band advantage (ranks)	4.33e+03
Selectivity-language contrast	0.5
Modulation focus improves	True
Dual-task math interference	3.7e+03
Capacity mean active@$\leq$5	1.38
Ignition median α@$\leq$5	n/a
Verbal-report top5 hit rate	0
Ablation J / random damage	116 / 98.5
